## 1. Basic Concepts

1.1 Introduction:

Structural Engineering

Analysis (SOM, SA)

- Equilibrium
- Compatibility
- Energy

Design
(RCC, PSC, steel)

- Safety
- Serviceability
- Durability
- Economy
- Asthetic

## i) Safely:

A structure must be safe with appropriate factor of safety [FOS] for loading that may come on it during its intended life.
ii) Serviceability:

A structure should provide the service for which it is constructed.
iii) Durability:

A structure should sustain loading for which it was designed and should perform well with safety and serviceability unto its whole life

Durability without serviceability or less margin of safely [FOS] iv> has no meaning

## iv) Economy:

Design and construction of any structure should be economical without affecting safely, serviceability and durability.
v) Asthenic:

If huge investment is involved in design and construction
of a structure then asthetic also plays an important role.

Ex. Considering a beam:
i) Safety: Reinforcement is provided
ii) Serviceability: Doubly reinforced section instead of singly reinforced section to reduce depth of section.
iii) Durability: Nominal cover, selection of material.
iv) Economy: Monolythic casting of beam and slab designed as $T$ section.
v) Asthetic: Half round section instead of rectangular section.
1.2 Cement Concrete:

It is a mixture of binding material [cement], fine aggregate, [sand], coarse aggregate, water and admixture in proper proportion to achieve concrete of desired properties at fresh state and hardened state.
1.2.1 Concrete Mix:
a) Nominal Mix:

- Based on experience.
- Mixing may be by weight or by volume. By weight is preferable
- Quantity of water is not fixed. It is provided as per site requirement.
- Nominal mix is allowed for M5 to M20.

|  | $C$ | $F A$ | $C A$ |
| :---: | :---: | :---: | :---: |
| $M 10$ | 1 | 3 | 6 |
| $M 15$ | 1 | 2 | 4 |
| $M 20$ | 1 | 1.5 | 3 |

b) Design Mix:

- Based on calculation as per. IS 10262 (2009)
- Proportioning must be by weight.
- Quantity of water is also fixed
- Design mix is allowed for M10 to M100.

### 1.2.2 Fresh Concrete:

Workability is the most important property of fresh concrete which is simply defined as "Ease to work with."

| Sr. <br> No. | Degree of Workability | Use | Slump | Compacting factor | Vee-bee time |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1. | Very low | - Road Construction. <br> - Shallow Section. | - | $0.75-0.8$ | 10-20 |
| 2. | Low | - Mass concreting. <br> - Lightly reinforced section | 25-75 | $0.8-0.85$ | 5-10 |
| 3. | Medium | - Heavily reinforced section <br> - Concreting by concrete pump. | 50-100 | 0.85-0.92 | 2-5 |
| 4. | High | - Piling | 100-150 | 0.92-above | - |
| 5. | Very High | - Tremie pipe concreting. | - | 0.92 -above | - |

* Tremie pipe concreting:

* Workability of Concrete can $\mathbf{5}$ of $\mathbf{3 2 6}$ as cred by following methods.

1. Slump test
2. Compacting factor Test
3. Vee-bee Test
4. Flow Test

### 1.2.3 Hardened Concrete:

After final setting time, concrete is assumed to be hard and it keeps on gaining strength for very long time [ 1 to 5 years]
a) Compressive Strength of Cube:

This is the compressive strength of cube size 150 mm subjected to uniaxial compression after 28 days from day of casting.
b) Characteristic Compressive strength of Cube:

It is the strength below which not more than $5 \%$ test results are expected to fall.

$$
f_{t}=\underbrace{}_{c k} \frac{4}{f_{t}=f_{c k}+k S}
$$
